ECONO ICAL HEATER CONTROLLER

Save energy and master the meter; control your power consumption with the ETI Wattmiser. Design and development by Phil Walker.

After this winter's snow, frost and electricity bills we are probably looking for ways to save a little money without losing comfort or convenience. This project is designed so that appliances such as electric fires or water heaters can be set to turn on a little before they are needed. This will ensure that the room or tank of water, etc is comfortable or ready for immediate use when required, but has not been consuming those precious units all the time.

The device could also be used to control other things such as tape recorders, radios and so on where the precise timing is not too critical.

Operation

The device operates by dividing the mains frequency (50 Hz) by 180, 224 to get a signal with a period of about 1 hour. The actual division required was 180,000 but the 180,224 was more easily achieved and the error involved was less than 1 part in 500, or about 40 seconds in the maximum period of 9 hours delay.

This 1 cycle per hour signal advances a divide-by-10 counter which has 10 separate outputs. Each output is active for 1 hour and only one is active at a time. One of the outputs is selected to drive the mains power switching triac — thus giving an 'on' period of 1 hour after a selectable off period. Also it is possible (if SW4 is on) to have the output come on permanently after its set delay (this is always the case on the 9 hour delay setting).

To use the device, set the number of hours delay with SW3, select whether '1 hour only' or 'permanently on' operation is required with SW4 and press SW2 to start the device working.

Installation

When using the device, the mains supply must be fed from a plug or switched fuse outlet containing a fuse rated for the appliance used. Also the wire used should be suitably rated — round flex rated at about 15 A usually sold for electric fires or similar applications could be used in most cases.

Construction

The construction of the PCB should present no great difficulties. The first thing to do is to ensure that the mounting holes are of a suitable size and that the correct ones are being used if the specified box is utilised. Next put some M3 x 12 mm bolts
